1 ABSTRACT

2

apparatus and methods of enhancing 3 Disclosed are digital audio signals after compression and decompression. 4 The methods and apparatus include receiving a digital 5 signal, harmonically enhancing decompressed audio 6 signal, adding warmth to the signal, and combining and 7 frequency equalizing the harmonically enhanced audio signal 8 and the warmth enhanced audio signal to provide a digital 9 enhanced decompressed audio signal. The apparatus is 10 preferably provided in software as instructions to a DSP. 11 Adjustments are included within the software for varying 12 levels of the harmonic enhancing and for varying levels of 13 the frequency equalizing. Methods of distribution are 14 disclosed which include providing the software free with 15 the inclusion in the software of either a one-time use, a 16 partial use, a partially enhanced audio signal use, or non-17 save adjustments, and selling the software for a price 18 without including the one-time use, the partial use, the 19 partially enhanced audio signal use, or the non-save 20 adjustments. 21
